

**Thousand  
Dry Tonnes/Year**

Forest residues are logging residues and other removable material left after carrying out silviculture operations and site conversions. Logging residue comprises unused portions of trees, cut or killed by logging and left in the woods. Other removable materials are the unutilized volume of trees cut or killed during logging operations.

**According to the draft permit for Adage Hamilton, LLC, a 56 megawatt biomass power plant proposed for new development in Hamilton County it will burn 47 tons an hour of dry woody fuel. Calculate if we have enough forest to fuel all of these biomass p...ower plants that target the rural areas of economic concern in the pine belt region of North Florida**[Read More](#)

US Forest Service records show steadily declining timber planting since 1988 when the federal subsidy encouraging landowners to put more land into pine tree planting expired and was not renewed. Timber planting has been steadily going down ever since/ It now costs more to replant than proposed biomass, other pulp/paper mills, consume more wood than is being replanted.

The biomass industry is now experimenting with other higher fiber crops such as cane, switchgrass, poplar, and eucalyptus to replace the genetically-engineered pines they now use. They will find that the soil is too dry and too nutrient-starved due to 60 years of intensive pine plantation punishment throughout northern Florida. The poor soil conditions and lack of water will make growing other crops, or continuing to grow pines, economically unfeasible
