

FACT SHEET: Lower St. Johns River Basin Tributaries Basin Management Action Plan Adopted by the DEP

The Florida Department of Environmental Protection (DEP) today announced adoption of the Lower St Johns River Basin Tributaries Basin Management Action Plan (BMAP).

The action plan, developed in partnership with the City of Jacksonville; JEA; the Duval County Health Department; the Florida Department of Agriculture and Consumer Services, and the Florida Department of Transportation, identifies projects and management actions needed to decrease bacteria in ten Waterbody Identification units (WBIDs) for the tributaries of the Lower St. Johns River Basin.

Where are the Lower St St Johns River Tributaries located? *The tributaries in this BMAP are urban tributaries of the City of Jacksonville; part of the Ortega, Trout, North Mainstem, and Intracoastal Waterway planning units.*

The Lower St. Johns River Basin Tributaries BMAP was developed under DEP's comprehensive approach, building partnerships with local, regional and state interests to identify and restore polluted waterbodies. In other areas of the state, similar efforts are currently underway.

Why was a BMAP needed in the Lower St. Johns River Basin?

The tributaries of the Lower St. Johns River are Class 3 waterbodies suitable for recreational use and the propagation and maintenance of a healthy, well-balanced population of fish and wildlife. Due to high levels of fecal coliform bacteria, these ten tributaries in the Lower St. Johns River Basin did not support these uses. In 2006 and 2009, the DEP adopted water quality restoration targets, called Total Maximum Daily Loads (TMDLs) that provided numerical water quality restoration targets for these ten WBIDs. The BMAP is the implementation plan that identifies the actions needed to achieve these restoration targets.

Who was involved?

The action plan, developed in partnership with the city of Jacksonville, JEA, the Duval County Health Department; and state agencies including the Florida Department of Agriculture and Consumer Services and the Florida Department of Transportation identified projects and management actions needed to decrease bacteria in these ten tributary WBIDs of the Lower St. Johns River Basin.

What will the BMAP accomplish?

Identification, elimination, and prevention of discharges of fecal coliform bacteria into these waterbodies will help achieve water quality standards and designated uses established by the DEP. The phased approach outlined in the BMAP involves implementation of projects like the removal of septic tanks close to surface waters alongside activities such as intensive inspection programs for OSTDS and sewer infrastructure to better prevent and control fecal coliform sources. The combined implementation of BMAP projects and management actions and the five-year BMAP milestone evaluation will eliminate sources and decrease levels of fecal coliforms of the Lower St. Johns River Basin Tributaries BMAP WBIDs.

Specific actions in the BMAP include highly integrated local stakeholder communication and response source identification protocols; wastewater infrastructure repair and upgrade, increased stormwater system maintenance management; septic tank regulations, ordinances and certified operator programs; best management practices for agricultural lands, public education and outreach; and continued water quality monitoring.
